

# TRACEABILITY

Maximum customer satisfaction and faultless production; traceability is the key to success.

Together with industrial world leaders and research institutes, Prevas offers state of the art production solutions, combining the best industrial experience with frontline academic research.

Traceability allows information on products to be obtained throughout the entire value chain, from the origin of the raw material until the end user receives the finished product.

Depending on what is to be achieved, traceability can be introduced for the entire value chain or for selected parts. The incentive for introducing traceability varies among different industries; it might be a matter of eliminating health risks, obstructing pirate copying or reducing environmental impact. Some industries, such as the food and pharmaceutical industries, must have traceability to satisfy regulatory requirements, while others have traceability as a means to help them achieve maximum customer satisfaction and faultless production. Examples include the automotive and electronics industries.

Regulatory requirements for traceability are also increasing in other industries, such as explosive products manufacturing.

For many years, Prevas has developed, supplied, and supported traceability systems on a national and international level for the world's leading companies within industries such as the telecom, pharmaceutical, food, and other manufacturing industries. In-depth industry know-how, combined with IT systems and platforms, makes Prevas a natural partner for the development and introduction of traceability solutions.
